More than 95% of our Neat Standards Grade products have a purity of 98% or greater and do not require purity corrections when preparing solutions for use with EPA, USTM, UST, and numerous other international methods.

Dilution Overview

It is often necessary to create dilutions or working standards prior to chemical analysis. Dilutions can be made as weight/weight, weight/volume, or volume/volume.

Depending on the form of your starting material, the calculations and best practices for dilutions vary.

Solid materials

Calculations:

$$\text{Final concentration (FC)} \times \text{Final Volume (FV)} = \text{Weight of Chemical Needed (W)}$$

Example: To make a 100 ml solution at a concentration of 0.1 mg/ml (100 ppm), starting with a pure solid chemical the calculation would be:

$$0.1 \frac{\text{mg}}{\text{mL}} \times 100 \text{ mL} = W \quad W = 10 \text{ mg}$$

Liquid Materials (Neat)

Liquid materials can be added by weight or by volume. The material density is used as needed to convert between units of measure. If you want to perform a dilution using volume for handling purposes, but the final concentration is in weight/volume units, the calculation would be:

$$\frac{\text{Final concentration (FC, w/v)} \times \text{Final Volume (FV)}}{\text{Density (d)}} = \text{Volume of Chemical Needed (V)}$$

Note

When weighing your material, use a clean, calibrated balance with an adequate number of significant figures.

Note

When performing a dilution by volume, always use calibrated volumetric pipets or a similar transfer tool.

Preparing a dilution from a solution

Subsequent dilutions from a prepared solution follow the same calculation logic. For instance, to dilute a 100ppm solution to 1ppm, extract a 1 ml aliquot from a 0.1 mg/ml (100ppm) solution and dilute it to your desired final volume (100 ml).

Best practices:

- ▶ Utilize high purity starting materials and solvents for solution preparation to avoid contamination.
- ▶ If your material is packaged in an ampoule, gently shake the ampoule to moisten its interior. If needed, gently tap the neck to ensure it completely drains.
- ▶ If your dilution includes a solvent that can evaporate at room temperature, it may be helpful to cool the material to minimize evaporation during measurement and maximize accuracy. Always confirm that the material is not temperature sensitive prior to chilling.
- ▶ Check for changes such as precipitation, layers, or other shifts in appearance before using your dilution. These can be indicative of immiscibility for your solvents.
